strategies and tactics of behavioral research and practice focuses on the most effective methods for measuring and evaluating changes in behavior the authors provide the rationale for different procedures for measuring behavior and designing within subject comparisons between control and intervention conditions the text explains the strengths and weaknesses of methodological alternatives for every topic so that behavioral researchers and practitioners can make the best decisions in each situation this classic text has been extensively revised to be more accessible and practical not only does it feature much more discussion of how research methods are

relevant to today's practitioners it also includes additional examples based on field research and service delivery scenarios with expanded coverage on creating experimental designs as well as new chapters on behavioral assessment the statistical analysis of data and ethical issues associated with research methods this book provides a strong foundation for direct behavioral measurement within subject research design and interpretation of behavioral interventions enriched with more pedagogical features including key terms tables summarizing important points figures to help readers visualize text and updated examples and suggested readings this book is an invaluable resource for students taking courses in research methods this book is appropriate for researchers and practitioners in behavior analysis psychology education social work and other social and health science programs that address questions about behavior in research or practice settings

this new combination volume of three books in one dealing with the topic of artifacts in behavioral research was designed as both introduction and reminder it was designed as an introduction to the topic for graduate students advanced undergraduates and younger researchers it was designed as a reminder to more experienced researchers in and out of academia that the problems of artifacts in behavioral research that they may have learned about as beginning researchers have not gone away for example problems of experimenter effects have not been solved experimenters still differ in the ways in which they see interpret and manipulate their data experimenters still obtain different responses from research participants human or infrahuman as a function of experimenters states and traits of biosocial psychosocial and situational origins experimenters expectations still serve too often as self fulfilling prophecies a problem that biomedical researchers have acknowledged and guarded against better than have behavioral researchers e.g. many biomedical studies would be considered of unpublishable quality had their experimenters not been blind to experimental condition problems of participant or subject effects have also not been solved we usually still draw our research samples from a population of volunteers that differ along many dimensions from those not finding their way into our research research participants are still often suspicious of experimenters intent try to figure out what experimenters are after and are concerned about what the experimenter thinks of them

this text examines different types of research questions the design or planning process and the analysis and interpretation of results in this edition the authors address both qualitative and quantitative methodology examine single subject and group experiments and advise on selecting an appropriate analysis a feature of this book is the research simulations which give students practice at each step of the research process these practice problems are accompanied by simulation feedback at the end of the chapter

the behavioral sciences investigate the cognitive processes that take place within living things and the behavioral interactions that take place between living things in the natural world naturalistic observation controlled scientific experimentation and mathematical modeling are all

used to conduct a methodical analysis and investigation of human and animal behavior through rigorous formulations and observation it aims to reach valid objective conclusions examples of behavioral sciences include psychology psychobiology anthropology economics and cognitive science in general behavioral science has demonstrated how human action frequently attempts to generalize about human behavior in relation to society and its effect on society as a whole behavioral sciences fall into two broad categories neural information and social relational sciences respectively the information processing sciences study how cognitive entities process social environment stimuli to make decisions make social judgments and perceive others in order for an organism to function and survive in a social environment relational sciences on the other hand focus on relationships

this volume was designed as both introduction and reminder an introduction to the topic for graduate students advanced undergraduates and younger researchers and a reminder to more experienced researchers in and out of academia that the problems of artifacts in behavioural research have not gone away

originally published in 1977 these examples of research and scholarly argument were collected in honor of professor sidney w bijou in the language of academics they constitute a festschrift a festival of scholarly writing performed to celebrate the career of a person who produced and stimulated others to produce exactly such contributions throughout a long valuable and productive professional history since 1955 dr bijou had worked almost exclusively within the approach variously labelled as the functional analysis of behavior the experimental analysis of behavior operant conditioning or skinnerian psychology from his point of view it seems clear the first of these labels was the correct one it was the principle of objective direct observable analysis that attracted him

this successful introduction to behavioral research methods written by two leaders in the field provides step by step guidance through the processes of planning an empirical study analyzing and interpreting data and reporting findings and conclusions it encourages readers to be analytical and critical not only in interpreting research findings but also in investigating what is behind the claims and conclusions in news reports of scientific results while the primary emphasis is on behavioral and social research a strong effort is made to connect these disciplines with the empirical reasoning used in other fields in order to underscore the unity of science the volume examines behavioral research and scientific method creative ideas and working hypotheses ethical considerations and guidelines observation and measurement design and implementation describing data and making inferences and statistical tests for those interested in an introduction to research methods

contrasts are statistical procedures for asking focused questions of data compared to diffuse or omnibus questions focused questions are characterized by greater conceptual clarity and greater statistical power when examining those focused questions if an effect truly exists we are more likely to discover it and to believe it to be real when asking focused questions rather than

omnibus ones researchers teachers of research methods and graduate students will be familiar with the principles and procedures of contrast analysis but will also be introduced to a series of newly developed concepts measures and indices that permit a wider and more useful application of contrast analysis this volume takes on this new approach by introducing a family of correlational effect size estimates

emphasizing question formulation data collection and the interpretation of results this text on behavioural research focuses on advanced methods the author assumes that the reader has had a first course in research methods and statistics

originally published in 1977 these examples of research and scholarly argument were collected in honor of professor sidney w bijou in the language of academics they constitute a festschrift a festival of scholarly writing performed to celebrate the career of a person who produced and stimulated others to produce exactly such contributions throughout a long valuable and productive professional history since 1955 dr bijou had worked almost exclusively within the approach variously labelled as the functional analysis of behavior the experimental analysis of behavior operant conditioning or skinnerian psychology from his point of view it seems clear the first of these labels was the correct one it was the principle of objective direct observable analysis that attracted him

behavioral research is making a significant impact on many academic disciplines its status as the source of some of the most profound research in the social sciences is unparalleled therefore it is not surprising that interest in behavior and operational research or is burgeoning even though understanding the relationship between knowledge behavior and action has been an academic preoccupation in or since the beginning of the discipline this book introduces the idea of behavioral or where the theoretical and empirical developments in the behavioral field are making an impression on or academics and practitioners alike the book provides a much needed overview that connects together theory methodology and practice and offers the state of the art on behavioral operational research theory and practice the book not only includes chapters by leading academics but also includes rich and insightful real life case studies by practitioners

systems research for behavioral science will be of interest to those in any discipline concerned with developments in science it is addressed principally to the student of human behavior as that study is approached from the social side previously the study of human behavior was the general area of science that had been slowest to respond to the exciting challenge of the modern systems outlook yet it is behavioral science that stands to gain the most from insights into the workings of more complex systems the editor presents not only a fair selection of systems research in behavioral science but also provides an extensive selection of important statements of general principles including several already considered classics hence this sourcebook may function in part as a principles text exposing the initiate to original pioneering statements as well as later work inspired by them and alerting the sizeable number of underexposed scholars who are over familiar with the few terms such as feedback boundary input and output that there are much

greater depths to plumb than meet the eye in semi popular accounts of cybernetics this volume is an overview of thinking that reflects a trend toward the system point of view some of the chapters are philosophical they discuss the significance of the trend as a development in the contemporary philosophy of science some are inevitably detailed and technical still other chapters discuss the relevance of concepts that are central in the system approach to particular fields of research the picture that emerges is far from that of a unified theory it is an open question whether much progress can be made by attempts to construct a unified theory of systems on some rigorous axiomatic base

with its concise and strategic approach to decision making methods in behavioral research by paul c cozby continues to gain in popularity among instructors and students alike building on a strong foundation of pedagogy and well chosen examples the ninth edition incorporates learning objectives new graphics and activities to increase student involvement and an updated appendix on writing research reports as well as making poster presentations
